

Docker Compose :- (Manage multi container Docker apps)
multi-container applications in single-engine mode.

cloud native apps are made of multiple smaller services
that interact to form a useful app.
↓
micro services.

* Docker Compose lets you describe an entire app in a single declarative config file and deploy with a single command.

Define multi-container apps in a YAML file

Pass YAML
file to
docker compose
command

Compose
deploys it
via Docker
API

Default name → docker-compose.yml

Compose file :-

top-level keys :- version, services, networks, volumes, etc
(↳ Consists of the micro-services keys
↳ Each service will be deployed as a container.
